

# Philologie computationnelle - TP Chrétien

JBC & FC

2023-2024

```
source("functions.R")
```

## Le chargement a nécessité le package : ggplot2

## Data

### Load texts

```
data = t(as.matrix(read.csv("chrestien_fw_abs.csv", row.names = 1, header = TRUE)[, c(-1,-2)]))
auts = read.csv("chrestien_fw_abs.csv", row.names = 1, header = TRUE)[, 1]
data = data[rowSums(data) > 0,]
colnames(data) = gsub(pattern = "000", replacement = "k", colnames(data))
data_abs_save = data
```

### Features extraction, culling and selection

Now, we will use survey method to keep only reliable features,

```
# select = selection(data, z = 1.645)
# select = select[,4]
# # Get relative frequencies
# data_abs_save = data
# data = relativeFreqs(data)
# # keep only reliable features
# data = data[select,]
```

## Dimensionality reduction

### Principal component analysis (PCA)

Let's use FactoMineR.

```
# Load FactoMineR and factoextra for better visuals
library('FactoMineR')
library('factoextra')
```

```
## Welcome! Want to learn more? See two factoextra-related books at https://goo.gl/ve3WBa
```

```
# And compute ACP. As the function expects individuals as lines and variables as columns, I'm transposing
myCA = CA(t(data)[1:79,], graph = FALSE)
```

```
## Warning in CA(t(data)[1:79, ], graph = FALSE): The columns quelque, quiconque,
## enjusque, cil, chasque, enteimes, endementre, eluec, dementre, entre_tant,
## neporuec, seviaus, decoste, hu, entrementre sum at 0. They were suppressed from
```

```
## the analysis
```

I can now look at the significance of my axes.

```
myCA$eig
```

```

```
#fviz_ca_row(myCA, geom=c("text"), labelsize=2)
```

```
fviz_ca_row(myCA, col.row = sub("\\_.*", "", rownames(myCA$row$coord)), title="", geom=c("point"), label
```

```
#fviz_ca_col(myCA, col.col = sub("\\_.*", "", rownames(myCA$col$coord)), title="", geom=c("point", "text"))
```

## Clustering

### Selecting features

### Weighting

In opposition to analyses like Correspondence analysis, that perform their own kind of ‘centering’ of the variables, here, we will do two types of normalisations:

- variables (rows) with z-scores;
- individuals (columns) with vector length normalisation (Euclidean norm).

```
data = normalisations(data)
```

And let's go.

## Clustering methods: hierarchical clustering

```
library(cluster)
maCAH = agnes(t(data), metric = "manhattan", method="ward")
#plot(maCAH, which.plots = 2)
# Et une fonction un peu plus esthétique
maCAH_save = maCAH
cahPlotCol(maCAH, k = 3)
```

```
## Warning: `guides(<scale> = FALSE)` is deprecated. Please use `guides(<scale> =`  
## "none")` instead.
```

## Class description

### Creating groups: cutting an AHC

If we want to describe a classification, in terms of the specificities of each group, several solutions are possible. We can start from supervised clustering from K-means or K-medoids, or from the cut of a CAH.

The number of classes should be chosen according to the dendrogram, and a height graph can be used (corresponding to the heights at which the branches of the dendrogram are separated).

```
maCAH = maCAH_save
maCAH2 = as.hclust(maCAH)
plot(maCAH2$height, type="h", ylab="heights")
```

```
#cahPlotCol(maCAH, k = 4)
```

And let's cut

```
#Je découpe en classes
classes = cutree(maCAH, k = "4") # ="4"
#J'ajoute les classes à mon tableau
myClassif = t(data)
myClassif = cbind(as.data.frame(myClassif), as.factor(classes))
colnames(myClassif[length(myClassif)])[] = "Classes"
```

```
myClassif[length(myClassif)]
```

```
##                               as.factor(classes)

```

It is also possible to use other computations of specificities, like Lafon (1984), that needs absolute frequencies.

```
# install.packages("textometry")
freq_abs = data_abs_save
# On splitte le corpus selon les classes
freq_abs_class = matrix(nrow = nrow(freq_abs), ncol = length(unique(classes)), dimnames = list(rownames(freq_abs), unique(classes)))
for(i in 1:length(unique(classes))){
  # sum the values for each member of the class
  freq_abs_class[, i] = rowSums(freq_abs[, classes == i])
}
```

```

}
specs = textometry::specificities(freq_abs_class)
# and now we can look at the specificities for class 1
# positive or negative
head(sort(specs[, 2], decreasing = TRUE))

```

```

##      tu      vos      i      et      si      je
## 71.3169 46.1653 21.0711 15.5810 13.4017 13.3224

```

```

head(sort(specs[, 2]))

```

```

##      de      son      par      lor      mi      le
## -34.5720 -30.3887 -22.4133 -21.6038 -19.2344 -18.6369

```

And one can use other varieties of non-parametric tests, such as the Mann-Whitney test, for example, to compare two populations...
